OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

SPARK Your Interest

This Episode centers on the guiding principles in the selection and use of teaching methods. It will also tackle lesson development in the OBTL way. The K to 12 curriculum and teacher education curriculum are focused on outcomes, standards, and competencies. This means that lessons must be delivered with a focus on outcomes. Likewise, this Episode dwells on the types of questions, questioning and reacting techniques that teachers make use of. The type of questions that teachers ask and their manner of questioning and reacting to student responses have a bearing on class interaction. This Episode strengthens the theories learned in the course, Teaching Methods and Strategies and in other professional subjects in Education.

TARGET Your Intended Learning Outcome

At the end of this Episode, I must be able to:

- identify the application of some guiding principles in the selection and use of teaching strategies.
- determine whether or not the lesson development was in accordance with outcome-based teaching and learning.
- identify the Resource Teacher's questioning and reacting techniques.
- outline a lesson in accordance with outcome-based teaching-learning.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

REVISIT the Learning Essentials

These are the guiding principles in the selection and use of teaching methods:

1. Learning is an active process.
2. The more senses that are involved, the more and the better the learning.
3. A non-threatening atmosphere enhances learning.
4. Emotion has the power to increase retention and learning.
5. Good teaching goes beyond the recall of information.
6. Learning is meaningful when it is connected to students' everyday life.
7. An integrated teaching approach is far more effective than teaching isolated bits of information.

Realizing the importance of these guiding principles in teaching and learning, the Department of Education promotes Standards-and Competency-Based teaching with its K to 12 Curriculum Guide. The Technical Education Skills Development Authority (TESDA) has been ahead of DepEd and the Commission on Higher Education (CHED) in the practice of Competency Standards-Based teaching and Assessment. CHED requires all higher education institutions in the country to go outcome-based education (OBE) in its CHED Memo 46, s. 2012. Outcome-based teaching and learning (OBTL) is OBE applied in the teaching-learning process. It is equivalent to competency-based and standards-based teaching and learning in the Kto12 Curriculum.

When you apply OBTL you see to it that the teaching-learning activities (TLAs) and in turn the Assessment Tasks (ATs) are aligned with the intended learning outcomes. In other words, in OBTL you first establish your intended learning outcomes (lesson objectives). Then you determine which teaching-learning activities (TLAs) and the assessment tasks (ATs) you will have to use to find out if you attained your ILOs.

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

In lesson planning, the ILOs are our lesson objectives, the TLA's are the activities we use to teach and the AT's are the evaluation part.

OBE and OBTL are not entirely new. They are importantly new. With mastery learning of Benjamin Bloom (1971), we were already doing OBE and OBTL.

Likewise, it is also important that teachers must be able to have a mastery of the art of questioning and reacting techniques to ensure the effective delivery of instruction.

These are the types of questions that teachers ask.

Types of Questions that Teachers Ask

1. Factual/Convergent/Low-level	Who, What, Where, When questions With one acceptable answer
2. Divergent/ Open-ended/ High-level/Higher-order/Conceptual	Open-ended; has more than one acceptable answer
a. Evaluation	
b. Inference	e.g. When the phone rang and Liz picked it up, she was all smiles. What can you infer about Liz?
c. Comparison	
d. Application	
e. Problem-solving	
3. Affective	e.g. How do you feel?

Episode 10 The Instructional Cycle

These are also some of the reacting techniques that teachers use:

1. Providing acceptance feedback
2. Providing corrective feedback
3. Giving appropriate and sincere praise
4. Repeating the answer
5. Explaining the answer / expanding the answer
6. Rephrasing the question
7. Asking follow up questions
8. Redirecting questions to other pupils
9. Soliciting student questions
10. Encouraging through non-verbal behavior
11. Criticizing respondent for his/her answer
12. Scolding for misbehavior or for not listening
13. Overusing expressions such as “okay”, “right”

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

Observe one class with the use of the observation sheet for greater focus then analyze my observations with the help of the guide questions.

1. The more senses that are involved, the more and the better the learning.	e.g. Teacher used video on how digestion takes place and a model of the human digestive system.
2. Learning is an active process.	After the report, the three remaining groups were required to prepare questions or clarifications, encouraging them to actively listen, think critically, and interact with the presenters during the open forum.
3. A non-threatening atmosphere enhances learning.	The teacher observed from the side and only gave slight corrections when needed, creating a calm and supportive environment where students felt comfortable presenting and asking questions.
4. Emotion has the power to increase retention and learning.	The reporting activity and open forum allowed students to express curiosity and excitement as they asked questions and discussed the topic, making the lesson more memorable.
5. Good teaching goes beyond recall of information.	The teacher didn't just let students memorize concepts; instead, they were encouraged to explain the process in their own words and relate it to real-life situations. This helped them understand the "why" behind the lesson, not just the "what."
6. Learning is meaningful when it is connected to students' everyday life.	The teacher connected the lesson to real-life examples, such as how the digestive system works when we eat our favorite foods. This made the topic more relatable and easier for students to understand and remember.
7. An integrated teaching approach is far more effective than teaching isolated bits of information.	The lesson combined visual aids, group presentations, and somewhat an open discussion, helping students connect ideas from science, communication, and real-life experiences.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

ANALYZE

What is the best method of teaching? Is there such a thing?

For me, I think there is really no single best method of teaching because every class and topic is different. From what I saw in my previous observations, it shows that a good method is when the teacher know what is the proper and suitable approach in different types of topic to discuss and mixes different ways, like letting students report, letting the students conduct experiments independently and giving time for an open forum. It worked well because everyone was involved and engage in the class, there are times where the students are the ones presenting the topic for a lesson while the teacher was observing them on the side. The resource teacher also correct them sometimes and provide more accurate example for the whole class to comprehend what is being discussed. In other days, like when they conduct an experiment, the resource teacher always let them discover and just follow the instructions given but always there to monitor and lend some help if needed. This approach also proves to be effective as well. So instead of looking for one “best” method, it’s better when the teacher chooses what fits the lesson and the students so that learning becomes active and meaningful for everyone.

REFLECT

Reflect on this question.

How do we select the appropriate strategy for our lessons?

For me, I think we can select the right strategy for our lessons by first understanding the topic we are going to teach and the kind of students we have in the class. From what I saw in my previous observations, it shows that a good strategy is when the teacher knows what is proper and suitable depending on the lesson and then combines different approaches. For example, one time the class topic is about the energy transformation, the resource teacher assigned two students to be the topic presenters. Using a laptop, they managed to give the class a decent and proper class discussion. This worked well because it matched the lesson that needed explanation and discussion, and it also kept the students active because of their practice of letting the other groups prepare questions or clarifications that they may ask to the topic presenters. On other days, I also observed times when the teacher used experiments instead of reporting, where the students followed instructions and discovered the answers on their own while the teacher was just monitoring and giving slight guidance.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

This shows that choosing the right strategy depends on many things like the objectives of the lesson, the time available, and the materials that can be used. Sometimes a topic fits better with reporting and discussion, while other times a hands-on activity or group work is more effective. The important part is that the resource teacher makes sure the strategy helps the students to understand the lesson, participate, and enjoy learning. There is no single formula for this, but when the teacher really thinks about what will make the class more engaging and meaningful, the strategy naturally fits and brings out the best learning experience for everyone.

Episode 10 The Instructional Cycle

Activity 10.2

Determining Outcome-Based Teaching and Learning

Resource Teacher : Sir Kim Paolo Armin A. Torcelino VI Signature:  School: Abaño Laboratory

Grade/Year Level : Grade 10-Naghihimagsik Subject Area : Science Date: 10/07/25

OBSERVE

Observe a class and answer the following questions.

1. Did the Teacher state the learning objectives/intended learning outcomes (ILOs) at the beginning of the class? Did he/she share them with the class? How?

Yes, the resource teacher state the learning objectives/intended learning outcomes (ILOs) at the beginning of the class discussion, he did it by reading it loudly to catch the students attention. He made sure that all of the students will hear it clearly.

2. What teaching – learning activities (TLAs) did he/she use? Did these TLAs help him/her attain his/her lesson objectives/ ILOs? Explain your answer.

From what I observed, the teacher used different teaching-learning activities that really made the class more engaging and connected to the topic. He started with a short discussion and questioning to activate the students' prior knowledge, then followed it with a group activity where they needed to analyze and share their ideas. I noticed that these TLAs were not just random tasks, they were clearly designed to match her lesson objectives. The students were actively participating, exchanging answers, and explaining their reasoning, which showed that they were actually learning. For me, these activities helped him attain his intended learning outcomes because they encouraged understanding, not just memorization. It was effective because every activity had a purpose that led toward achieving the objectives she set at the start of the lesson.

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 10 The Instructional Cycle

3. What assessment task/s did teacher employ? Is/Are these aligned to the lesson objectives/ILOs?

The resource teacher used both formative and performance-based assessments. For example, he asked oral questions during the discussion to check for understanding and later gave a short written task where students needed to apply what they learned. These assessment tasks were clearly aligned with the lesson objectives because they measured exactly what the students were expected to achieve. If the objective was for students to “identify and explain,” then the questions and tasks were designed to test those skills. I think it was well-planned because the assessment reflected the same level of learning as the objectives, simple, clear, and achievable.

ANALYZE

1. What are your thought about Outcome-Based Teaching and Learning (OBTL)?

For me, Outcome-Based Teaching and Learning (OBTL) is a good approach because it gives both the teacher and students a clear direction of what should be achieved by the end of the lesson. It is like everyone knows the goal, so the learning activities and assessments are all connected to that goal. What I also like about OBTL is that it focuses more on what students can actually do or apply after learning, not just what they can memorize. In my experience, it makes lessons more meaningful and organized because every part of the teaching process has a purpose.

REFLECT

Reflect on the use of OBTL?

Reflecting on the use of OBTL, I realized how effective it is in making teaching more purposeful. It reminds me of when I was still a student struggling to understand why we were learning certain lessons. But with OBTL, everything feels clearer because the objectives guide both teaching and learning. It helps teachers plan lessons that truly aim for understanding and application, not just passing exams. I also see how it values students' growth, how they think, perform, and apply what they've learned in real life. If I will be lucky and be a teacher in the future, I'll definitely use OBTL because it helps create lessons that not only meet objectives but also prepare students for real world challenges.

Activity 10.3

Applying Effective Questioning Techniques

Resource Teacher : Sir Kim Paolo Armin A. Torcelino VI Signature: [Signature] School: Abaño Laboratory

Grade/Year Level : Grade 10-Naghihimagsik Subject Area : Science Date: 10/07/25

OBSERVE

Observe a class activity. You shall focus on the questions that the Resource Teacher asks during the classroom discussion. Write the questions raised and identify the level of questioning.

Types of Question	Examples of Questions that the Resource Teacher Asked
1. Factual/ Convergent Closed/ Low level	"What is momentum?" "What is the formula in calculating the momentum?"
2. Divergent/ Higher - level/ Open - ended/ Conceptual	
a. Evaluation	How would you evaluate the importance of understanding the momentum in different field?
b. Inference	If a heavy truck and a small car are moving at the same momentum, what can you infer about their relative velocities?
c. Comparison	Compare and contrast the concept of momentum and kinetic energy. How are they related, and how do they differ?
d. Application	Describe a real-world situation where the principle of conservation of momentum is crucial, and explain why?

Episode 10 The Instructional Cycle

e. Problem-solving	If a truck has a mass of 1,000 kilograms and is travelling with a speed of 50m/s, what is its momentum?
3. Affective	How does the concept of momentum influence your understanding of cause and effect in everyday events?

ANALYZE

1. Neil postman once said: “Children go to school as question marks and leave school as periods!” Does this have something to do with the type of questions that teachers ask and the questioning and reacting techniques that they employ?

Yes, I think what Neil Postman said has a lot to do with the kind of questions teachers ask and how they respond to students. For me, it means that sometimes, as students grow older, they lose their curiosity because teachers focus too much on getting the “right answers” instead of encouraging them to ask “why” and “how.” I’ve also experienced that, when teachers only expect one correct answer, I tend to just memorize instead of think deeply. But when teachers ask open-ended questions and let students explore different ideas, learning becomes more exciting and meaningful. So I believe the way teachers ask and react really shapes how students think, whether they stay curious or just follow.

REFLECT

Reflect on “The importance of using various reacting techniques

For me, using various reacting techniques is really important because it makes the classroom more alive and supportive. I have noticed that when a teacher reacts positively like nodding, smiling, or giving encouraging feedback, it really boosts students’ confidence and makes them more willing to participate. Back when I was in high school, I remember one teacher who always acknowledged even the smallest effort with a kind word or a follow-up question. It made me feel that my answers mattered, even if they weren’t perfect, it is encouraging for me as a student, to participate more to the class. I realized that teachers’ reactions can either motivate or discourage students. That’s why, as a future teacher, I want to use different reacting techniques, not just saying “good job,” but also asking probing questions, giving suggestions, or connecting students’ answers to the lesson because these small gestures can inspire students to think more, speak more, and believe in their ideas.
