Episode 13 - Assessment OF Learning (Summative Assessment)

SPARK Your Interest

Episode # 12 dwelt on Assessment *for* Learning (formative assessment) and Assessment *as* Learning (self-assessment). These refer to assessments that teachers do while still teaching and students' assessing their own learning. Episode # 13 will be focused on Assessment of Learning. When teachers have done everything they can to help learners attain the intended learning outcome/s, teachers subject their students to assessment for grading purposes. This is referred to as an assessment *of* learning which is also known as **summative** assessment.

Episode # 13 will be focused on 1) assessment of learning in the cognitive, psychomotor, and affective domains with the use of traditional and non-traditional assessment tasks and tools, 2) assessment of learning outcomes in the different levels of cognitive taxonomy; 3) construction of assessment items with content validity; 4) Table of Specifications; 5) Portfolio, 6) Scoring Rubrics, 7) The K to 12 Grading system and 8) reporting Students' Performance.

TARGET Your Intended Learning

At the end of this episode, I must be able to demonstrate an understanding of the design, selection, organization, and use of summative strategies consistent with the curriculum requirements by being able to:

- Determine the alignment of assessment tools and tasks with intended learning outcomes;
- Critique traditional and authentic assessment tools and tasks for learning in the context of established guidelines on test construction;
- Evaluate non-traditional assessment tools including scoring rubrics;
- Examine different types of rubrics used and relate them to the assessment of student learning;
- Distinguish among the 3 types of learners' portfolios;
- Evaluate sample portfolio;
- Construct assessment questions for HOTS following Bloom's Taxonomy as revised by Anderson and Krathwohl and Kendall's and Marzano's Taxonomy;
- Explain the function of a Table of Specifications;
- Distinguish among types of learners' portfolio and their functions;
- Compute students' grade based on DepEd's grading policy;
- State the reason(s) why grades must be reported to parents; and describe what must be done

Episode 13 - Assessment OF Learning (Summative Assessment)

OBSERVE, ANALYZE, REFLECT

Activity 13.1

Aligning Assessment Task with the Learning Outcome

Resource Teacher: **Sir Kim Paolo Armin A. Torcelino VI** Teacher's Signature: _____

School: **Abaño Laboratory** Grade/Year Level: **10** Subject: **Science** Date: **10/07/25**

TARGET Your Intended Learning

- Determine alignment of assessment task with learning outcome.
- Formulate assessment task aligned with the learning outcome.

REVISIT the Learning Essentials

- In accordance with Outcome-Based Teaching-Learning, the learning outcome determines assessment task.
- Therefore, the assessment task must necessarily be aligned to the learning outcome.

OBSERVE

1. Observe at least 3 classes - 1 Physical or Biological Science or Math, English, Filipino; 1 Social Science or Literature/Panitikan, EsP and 1 P.E/Computer /EPP/ TLE.

Subjects	Learning Outcome/s	Assessment Task (How did the Teacher assess the learning outcome/s? Specify.	Is the assessment tool/task aligned to the learning outcome/s?	If not aligned, improve on it.

Episode 13 - Assessment OF Learning (Summative Assessment)

Physical/Biological Science/Math/ English/Filipino	Identify monomilas, binomials, and polynomials	Written quiz or exam with problems on polynomial identification, operation, and factoring.	YES	
	Add, subtract, multiply, and divide polynomials	Group activities and worksheets for practice problems	YES	
	Factor quadratic polynomial equations to find roots	Real-life problem solving task involving polynomials	YES	

ANALYZE

1. Are all the assessment tasks aligned to the learning outcome?

Not all of the assessment tasks were aligned to the learning outcomes. For example, in P.E., the teacher used a written quiz asking students to enumerate the steps of tango, which doesn't really show if students can perform the dance properly. For me, it would have been better to use a performance-based assessment. However, in subjects like Social Science and Mathematics, the assessment tasks were well-aligned since they directly measured what the students were expected to learn and apply in real situations.

2. What are possible consequences if the teacher's assessment tasks are not aligned to learning outcome/s? Does this affect assessment results? How?

It is very evident that if the assessment tasks are not aligned to the learning outcomes, students might be tested on skills or knowledge that are not actually part of what they were supposed to learn. This can lead to inaccurate results, where grades do not truly reflect what the students know or can do. It can also cause confusion and frustration among learners because they might feel that the lessons and tests don't match.

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

3. Why should assessment tasks be aligned to the learning outcomes?

For me, assessment tasks should be aligned to the learning outcomes to make sure that what is being taught, practiced, and tested are all connected. Alignment ensures that students are evaluated based on what they were meant to learn, making the assessment fair and meaningful.

- Reflect on past assessments you have been through. Were they all aligned with what your teacher taught (with learning outcomes)?

Based on my experience, not all assessments I have taken were fully aligned with what our teacher discussed in class. There were times when the quizzes or exams included topics that were only mentioned briefly or not discussed at all specially when I was in high school. However, there were also teachers who made sure that every activity and test was connected to our lessons, which made studying easier and more meaningful and when assessments were aligned, I felt more confident and perform better because I knew exactly what to expect and how to prepare to the exam.

- How did this affect your performance? As a future teacher, what lesson do you learn from this experience and this observation?

When the assessments were not aligned, my performance was affected because I sometimes felt lost and unsure about what to study. It was frustrating to answer questions that didn't match what we learned in class. On the other hand, when the lessons, activities, and assessments were consistent, I performed better and understood the topics more clearly and deeply. As a future teacher, I learned that aligning assessments with learning outcomes is very important because it makes learning fair, and purposeful. It also helps students clearly see the connection between what they learn and how they are evaluated.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

Activity 13.2

Observing the use of Traditional Assessment Tools

Resource Teacher: Sir Kim Paolo Armin A. Torcelino VI Teacher's Signature:

School: Abaño Laboratory Grade/Year Level: 10 Subject: Science Date: 10/07/25

TARGET Your Intended Learning

- Critique traditional assessment tools and tasks for learning in the context of established guidelines on test construction.

REVISIT the Learning Essentials

- Traditional assessment tools are also called paper-and-pencil tests.
- Traditional assessment tools usually measure learning in the cognitive domain.
- Traditional or paper-and-pencil tests can be classified either as selected-response tests or constructed-response/supply types of tests.
- Common examples of selected-response types of tests are alternate response tests (True-False, yes-no), multiple choice, and matching type of test.
- Common examples of constructed-response types of tests are short answers, problem-solving, and essays.

OBSERVE

1. Observe classes and pay particular attention to the assessment tool used by the teacher.
2. With teacher's permission, secure a copy of the assessment tool.

Direction: Put a check (/) on the test that which teacher used. From your teacher's test items, give an example.

Type of Traditional Assessment Tool/Paper-and-Pencil Test	Put a check (/) Here	Learning Outcome Assessed	Sample Test Item of Resource Teacher	Comments (Is the assessment tool constructed in accordance with established guidelines?) Explain your answer.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

1. Which assessment tools/tasks were most commonly used by teacher? Which ones were rarely used? Why were they rarely used?

Based on my observation, the teacher most commonly used constructed-response type assessments, specifically problem-solving tasks. These allowed students to apply the kinematic equations they learned to real-life projectile motion problems. It was clear that the teacher focused on assessing understanding through application rather than simple recall. While, the selected-response types like multiple choice, matching type, and true-or-false were rarely used. I think they were rarely used because Physics often requires computation and explanation, which cannot be measured effectively through short or limited-choice answers. The resource teacher probably wanted to see how students analyze and solve using formulas, not just guess from options.

2. Based on your answers found in the Tables above in which type of assessment tools and tasks were the Resource Teachers most skilled in test construction? Least skilled?

Based on the table, the Resource Teacher was most skilled in constructing problem-solving assessment tasks. The questions were clear, realistic, and followed the proper guidelines for assessing higher-order thinking skills. The problems that he was using was also aligned well with the learning outcomes and promoted critical thinking. Meanwhile, the teacher seemed least skilled or less focused on selected-response types, since none were used or shown during my observation. But I think, this might be because these types of tests are simpler to construct but don't always match the analytical and application skills needed in Physics lessons in which they are discussing.

3. Can an essay or other written requirements, even if it is a written paper-and-pencil test, be considered an authentic form of assessment? Explain your answer.

Yes, an essay or other written requirement can still be considered an authentic form of assessment, especially if it asks students to apply what they learned to real situations or express their understanding in their own words. Because authentic assessment is not just limited to doing hands-on tasks, it is also about how well the activity reflects real-life thinking and problem-solving of the students. For example, if a student writes an essay explaining how kinematic equations apply to sports or everyday motion, it still shows meaningful learning and application beyond memorization, so technically speaking, an essay or other written requirement can still be considered an authentic form of assessment.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

ANALYZE

How good are you at constructing traditional assessment tools? Which do you find most difficult to construct? Any lesson/s learned?

I can say that I'm just fairly good at constructing traditional assessment tools, especially when it comes to short-answer and completion types because they are more direct and easier to align with specific learning outcomes. Unfortunately however, I find problem-solving and essay-type questions the most challenging to construct. Because it is sometimes hard to make sure that the questions are clear, measurable, and not too difficult for the students' level.

From this experience, I learned that creating a good assessment takes careful planning and it is not just about asking questions but making sure that they truly measure what students are expected to learn. I realized that clarity, alignment, and fairness are very important and must consider in test construction. As a future teacher, I will make sure to design assessment tools that accurately reflect both understanding and application of knowledge of my students.

Activity 13.3

Observing the use of Non-traditional Assessment Tools and Scoring Rubrics

Resource Teacher: Sir Kim Paolo Armin A. Torcelino VI Teacher's Signature: _____

School: Abaño Laboratory Grade/Year Level: 10 Subject: Science Date: 10/07/25

TARGET Your Intended Learning

- Evaluate non-traditional assessment tools including scoring rubrics.

REVISIT the Learning Essentials

- There are learning outcomes that cannot be assessed by traditional assessment tools.
- Authentic/nontraditional/alternative assessment tools measure learning outcomes like performance and product.
- These performance task and product are assessed by the use of scoring rubric.
- A rubric is a coherent set of criteria for student's work that includes descriptions of levels of performance quality on the criteria. (Brookhart, 2013)
- The main purpose of rubrics is to assess performances and products.
- There are two types of rubrics – analytic and holistic. Analytic rubrics describe work on each criterion separately while a holistic rubric assesses a student's work as a whole.
- For diagnostic purposes, the analytic rubric is more appropriate.
- For holistic view of a product or performance, the holistic rubric will do.
- A good scoring rubric contains the criteria against which the product or performance is rated, the rating scale and a description of the levels of performance.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

1. Between analytic and holistic rubrics which one was more used? Why do you think that type of rubric was used more?

Based on my observation, the analytic rubric was used more often by the teachers. I think this type of rubric was preferred because it gives a more detailed breakdown of students' performance. Each criterion is like preparation, data recording, analysis, and communication, is graded separately, which helps the teacher clearly see where the students did well and where they need improvement. It also provides fairer and more objective scoring since every part of the task is evaluated.

2. Based on your answers in # 1, what can you say about the scoring rubrics made and used by the Resource Teachers?

The scoring rubrics made and used by the Resource Teachers were well-constructed and easy for the students to understand. The criteria were clear, specific, and aligned with the learning outcomes of the activity. I could see that they followed proper guidelines since each level of performance had a description that made scoring more consistent. Overall, the rubrics system helped make the assessment process more transparent for both the teacher and the students.

3. Will it make a difference in the assessment of student work if the teacher rates the product or performance without scoring rubrics? Explain.

Yes, it would make a big difference if the teacher rated without using rubrics. Without a rubric, the grading might become subjective and unclear because there would be no standard guide for judging performance. It might also be prone to bias judging, because the teacher might be bias on those students that perform well in his/her class. Also, the students might also feel confused or unfairly graded since they wouldn't know what the teacher expected from them. The rubrics serve as a guide for both teaching and learning because they make expectations clear and ensure that all students are assessed fairly.

4. If you were to improve on one scoring rubric used, which one and how?

If I were to improve one rubric, for me it would be the analytic rubric used for the "Bouncing Ball Experiment." Although it was already clear and effective, I would just add a criterion for creativity and presentation of the written report. For me, this would encourage students to present their findings in a more engaging and organized way, showing not just accuracy but also communication skills.

5. Can an essay or other written requirements, even if it is a written paper-and-pencil test, be considered an authentic form of assessment? Explain your answer.

Yes, an essay or other written requirement can still be an authentic form of assessment if it allows students to apply what they have learned in real or meaningful ways. For example, if an essay asks students to explain a science concept using a real-life situation or reflect on an experiment, it goes beyond memorization, it rather shows the understanding and personal insight of the students. For this reason, we can say that a well-designed written task can be an effective Authentic assessment for the students.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

6. Can rubrics help make students become self-directed or independent learners? Do rubrics contribute to assessment AS learning (self-assessment) What if there were no rubrics in assessment?

Yes, rubrics can really help students become self-directed learners. When students are aware of the criteria, they can monitor their own progress and identify what areas they need to improve on. Rubrics support assessment as learning because they encourage self-assessment and reflection. Without rubrics in assessments, students might only focus on grades instead of understanding what quality work looks like, because what rubrics do is guide them toward setting their own learning goals and taking responsibility for their performance.

7. Does the Scoring Rubric in this FS Book 1 help you come up with better output?

Yes, the scoring rubric in this FS Book 1 definitely helps me produce better output, because it clearly shows me what is expected for each task, so I can plan and organize my work based on the given criteria. The rubric also reminds me to focus not just on completing the task but on doing it with quality. It serves as my checklist to make sure that my answers meet the standards, which helps me become more mindful and confident in my work.

REFLECT

Are authentic assessment tools and tasks new? Reflect on your experiences of tests for all the years as a student.

For me, authentic assessment tools and tasks are not entirely new, but I can say they were not always common when I was a younger student. Most of the time, the tests I encountered as a student were just the traditional one, like multiple-choice, true or false, and identification types of exams. Those assessments mainly focused on how well we could memorize facts or recall information from the lessons. Back then, I thought doing well in school simply meant getting the right answers on paper and just comply for high grades.

It was only when I reached senior high school and college that I started to experience more authentic assessments. Instead of simply answering written exams, sometimes we were asked to work on projects, experiments, reports, and presentations that connected our lessons to real-life applications. I came to realized that these kinds of assessments made learning more meaningful because they required me to apply what I had learned rather than just memorize facts.

One memorable example was when we were tasked to create a device that demonstrated one of the principles we discussed in our class. My group came up with “**The Bumble-Box,**” a storage box powered by water pressure through syringes that operates based on **Pascal’s Principle**. We built it during our second year in college, and everything went smoothly. That experience taught me how applying scientific principles through hands-on work can deepen the understanding and make learning both fun and purposeful.

Looking back at it, I can see how authentic assessments helped me grow not only as a student but also as a learner. They made me more confident and responsible because I understood that learning

was not just about grades but also about how knowledge could be used in real life. So, while authentic assessments may seem “new” to some, I think they are actually a better way of showing what students can truly do and understand. As a future teacher, I would like to use more authentic assessments in my class because they bring out creativity, critical thinking, and deeper understanding skills of my students that traditional tests alone cannot measure.

It clearly evaluated how well the message was delivered, the accuracy of the information, and the level of creativity, all of which reflected the objectives of the task.

• Observations

Looking back on the use of scoring rubrics, I realized how much they actually shape both teaching and learning. Having an analytic rubric with well-defined and detailed criteria really helped students and teachers stay on the same page. It made grading clearer and fairer since everyone understood what was being measured. I also noticed that students became more reflective, they could see their strengths, recognize their weaknesses as well. In the end, rubrics didn’t just make assessment easier, they turned it into a learning tool that encouraged deeper understanding and active participation in the lesson.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

- Reflection

I came to realized that authentic assessments are not entirely unfamiliar to me, but I have come to appreciate their value much more as time goes on. Back when I was a student, I always looked forward to activities where I could apply what I learned, like doing experiments instead of just recalling definitions. It was like the “Bouncing Ball Experiment,” of grade 10 which made science feel real and meaningful because it connected theory to everyday life. From their activity, I also understand that using rubrics and authentic tasks doesn’t just make learning more enjoyable, it also promotes fairness. As a future educator, I hope to design lessons that use clear rubrics and hands-on tasks like this, so my students can learn by doing and see how their knowledge fits into the world around them.

- A photo of a product assessed and a document performance test

Students are actively participating in a hands-on science activity titled “*Bouncing Ball Experiment.*” In this experiment, they observe how height and force affect the bounce of a ball, allowing them to apply physics concepts through practical investigation and teamwork.

Episode 13 - Assessment OF Learning (Summative Assessment)

Activity 13.4

Scrutinizing the Types and Parts of a Portfolio

Resource Teacher: **Sir Kim Paolo Armin A. Torcelino VI** Teacher's Signature: 

School: **Abaño Laboratory** Grade/Year Level: **10** Subject Area: **Science** Date: **10/07/25**

TARGET Your Intended Learning

- Evaluate a sample portfolio
- Distinguish among the 3 types of portfolio.

DISCOVER the Learning

- A portfolio is a purposeful collection of selective significant samples of student work accompanied by clear criteria for performance that prove student effort, progress, or achievement in a given area or course.
- A portfolio of student's work is direct evidence of learning. But it is not a mere collection of student's work. The students's reflections must accompany each output or work.
- A portfolio is different from a *work folder*, which is simply a receptacle for all work, with no purpose to the collection. A portfolio is an intentional collection of work guided by learning objectives.
- Effective portfolio systems are characterized by a clearer picture of the student's skills to be addressed, student involvement in selecting what goes into the portfolio, use of criteria to define quality performance as a basis for communication, and self-reflection through which students share what they think and feel about their work, their learning and about themselves.
- There are several types of portfolios depending on purpose. They are: 1) development or growth portfolio, 2) best work or showcase or display portfolio, and 3) assessment/evaluation portfolio.

OBSERVE

1. Ask your Resource Teacher for samples of portfolio, if any. If there is, select one best portfolio from what you examined.

Management

ID 9108653506

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

2. If none, research for a sample portfolio and include them in *My Learning Artifacts*.
3. Based on the sample portfolio given by your Resource Teacher/researched by you, accomplish Observation Sheet #
4. Put a check in the right column.

What a Portfolio Includes

Elements of a Portfolio	Present?	Missing?
1. Clear objectives – The objectives of the lesson/unit/course are clear which serve as a bases for selection.		✓
2. Explicit guidelines for selection – What, when, where how are products/documented performances selected?		✓
3. Comprehensible criteria-the criteria against which the portfolio is graded must be understood by the learners.		✓
4. Selective significant pieces – The portfolio includes only the selected significant materials.	✓	
5. Student's reflection – There is evidence that students reflected on their learning.	✓	
6. Evidence of student participation in selection of content of portfolio – There is proof that the students took part in the selection of the content of the portfolio.	✓	

1. With OBE in mind, which should be the basis for the selection of pieces of evidence to show that what the student was supposed to learn was learned?

When applying Outcomes-Based Education (OBE), the selection of portfolio pieces should always be anchored on the intended learning outcomes or competencies that students are expected to master. Every artifact or task included in the portfolio must serve as concrete proof of the learner's understanding, skills, or values aligned with the curriculum. This means that each entry, whether a written work, performance task, or reflection, should represent meaningful evidence of learning growth and achievement.

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

2. Scrutinize the elements of this portfolio. Based on the parts, under which type of portfolio does this fall?

Based on the elements present, this portfolio most closely resembles a **Showcase Portfolio**.

John Colwin Sanico portfolio's components:

Cover Page: "My Portfolio in Science" - Introduces the subject.
About Me: A brief personal introduction of the student.
Table of Contents: Provides an overview of the portfolio's contents.
"What is science for you": Include the definition of science
Best Output: Shows the student's best work with a volcano model and reflection.
Best Group Activity: Highlights a collaborative effort and the student's participation.

3. Where and when does the teacher make use of each of the 3 types of portfolio?

Teachers utilize developmental portfolios during the learning process to monitor student progress and promote self-reflection on areas of improvement. Showcase portfolios, on the other hand, are used toward the end of a grading period to display a learner's best and most representative works, celebrating achievements and milestones. Meanwhile, assessment portfolios serve as tools to evaluate whether students have achieved specific learning outcomes or standards, often used as supporting evidence for grades or competency evaluation. In practice, a teacher may begin with a developmental portfolio to track learning, select exemplary works for a showcase portfolio, and then integrate these into an assessment portfolio to measure mastery.

Have portfolios made the learning assessment process more inconvenient? Is the effort exerted on portfolio assessment commensurate to the improvement of learning and development of the learner's metacognitive process that results from the use of a portfolio?

Using portfolios has not made the learning assessment process inconvenient. Instead, it has made it more meaningful and helpful. Even though preparing and organizing a portfolio takes time and effort,

Episode 13 - Assessment OF Learning (Summative Assessment)

it allows teachers and students to see clear progress and improvement over time. It also serves as proof of what the learner has learned and how their understanding and skills have grown.

Portfolio assessment helps students become more responsible and independent because they choose and present their best work. It also builds critical thinking and reflection, helping them see what they do well, what they need to improve, and how they can reach their goals.

The effort put into making a portfolio is worth it because it helps improve learning and thinking skills. By reflecting on their work, students become more aware of how they learn and how to get better. Overall, portfolios make learning more real and personal because they focus on growth, reflection, and self-awareness, not just on getting high grades.

Determining the Level of Teacher's Questions

Resource Teacher: Sir Kim Paolo Armin A. Torcelino VI Teacher's Signature: 

School: Abaño Laboratory Grade/Year Level: 10 Subject Area: Science Date: 10/07/25

TARGET Your Intended Learning

- Construct assessment questions to measure HOTS following Bloom's and Anderson's revised taxonomy and Kendall's and Marzano's taxonomy.

REVISIT the Learning Essentials

Table: 1.4 Example of Cognitive Activities

Cognitive Process	Examples
Remembering - Produce the right information from memory	
Recognizing	
Recalling	- Name three 19th-century women English authors. - Write the multiplication facts. - Reproduce the chemical formula for carbon tetrachloride.
Understanding - Make meaning from educational materials or experiences	
Interpreting	- Translate a story problem into an algebraic equation. - Draw a diagram of the digestive system. - Paraphrase Jawaharlal Nehru's tryst with destiny speech.
Exemplifying	- Draw a parallelogram. - Find an example of stream-of-consciousness style of writing. - Name a mammal that lives in our area.
Classifying	- Label numbers odd or even. - List the events of the Sepoy Mutiny of 1857. - Group native animals into their proper species.
Inferring	
Comparing	Explain how the heart is like a pump.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

	- Compare Mahatma Gandhi to a present-day leader. - Use a Venn diagram to demonstrate how two books by Charles Dickens are similar and different.
Explaining	- Draw a diagram explaining how air pressure affects the weather. - Provide details that justify why the French Revolution happened when and how it did. - Describe how interest rates affect the economy.
Applying – Use a procedure	
Executing	- Add a column of two-digit numbers. - Orally read a passage in foreign language. - Have a student open house discussion.
Implementing	- Design an experiment to see how plants grow in different kinds of soil. - Proofread a piece of writing. - Create a budget.
Analyzing – Break a concept down into its parts and describe how the parts relate to the whole	
Differentiating	List the important information in a mathematical word problem and cross out the
Organizing	- Place the books in the classroom library into categories. - Make a chart of often-used figurative devices and explain their effect. - Make diagram showing the ways plants and animals in your neighborhood interact with each other.
Attributing	- Read letters to the editor to determine the authors' points of view about a local issue. - Determine a character's motivation in a novel or short story. - Look at brochures of political candidates and hypothesize about their perspective on issues.
Evaluating – Make judgments based on criteria and syllabus guidelines	
Checking	- Participate in writing group, giving peers feedback on organization and logic or arguments. - Listen to a political speech and make a list of any contradictions within the speech.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

	Review a project plan to see if all the necessary steps are included.
Critiquing	- Judge how well a project meets the criteria of a rubric. - Choose the best method for solving a complex mathematical problem. - Judge the validity of arguments for and against astrology.
Creating – Put pieces together to form something new or recognize components of a new structure	
Generating	- Given a list of criteria, list some options for improving race relations in the school. - Generate several scientific hypotheses to explain why plants need sunshine. - Propose a set of alternatives for reducing dependence on fossil fuels that address both economic and environmental concerns. - Come up with alternative hypotheses based on criteria.
Planning	- Make a storyboard for a multimedia presentation on insects. - Outline a research paper on Mark Twain's views on religion. - Design a scientific study to test the effect of different kinds of music on hens' egg production.
Producing	- Write a journal from the point of view of mountaineer. - Build a habitat for pigeons. - Put on a play based on a chapter from a novel you're reading.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

The New Taxonomy (Marzano and Kendall, 2007)

Level of Difficulty	Process	Useful Verbs, Phrases, Definitions
6 Self System Thinking	Examining Importance	The student can analyze how important specific knowledge is to them.
	Examining Efficacy	The student can examine how much they believe they can improve their understanding of specific knowledge.
	Examining Emotional Response	The student can identify emotional responses associated with a piece of knowledge and determine why those associations exist.
	Examining Motivation	The student can examine their own motivation to improve their understanding or competence in specific knowledge.
5 Metacognition	Specifying Goals	The student can set specific goals relative to knowledge and develop a plan for accomplishing the goal.
	Process Monitoring	The student can self-monitor the process of achieving a goal.
	Monitoring Clarity	The student can determine how well they understand knowledge.
	Monitoring Accuracy	The student can determine how accurate their understanding of knowledge is and defend their judgment.
4 Knowledge Utilization	Investigating	investigate, research, find out about, take a position on, what are the differing features of, how & why did this happen, what would have happened if The student generates a hypothesis and uses the assertions and opinions of others to test the hypothesis.
	Experimenting	experiment, generate and test, test the idea that, what would happen if, how would you test that, how would you determine if, how can this be explained; based on the experiment, what can be predicted The student generates and tests a hypothesis by conducting an experiment and collecting data.
	Problem-Solving	solve, how would you overcome, adapt, develop a strategy to, figure out a way to, how will you reach your goal under these conditions The student can accomplish a goal for which obstacles exist.
	Decision-Making	decide, select the best among the following alternatives, which among the following would be the best, what is the best way, which of these is most suitable The student can select among alternatives that initially appear to be equal and defend their choice.
3 Analysis	Specifying	make and defend, predict, judge, deduce, what would have to happen, develop an argument for, under what conditions The student can make and defend predictions about what might happen.
	Generalizing	what conclusions can be drawn, what inferences can be made, create a principle, generalization or rule, trace the development of, form conclusions The student can infer new generalizations from known knowledge.
	Analyzing Errors	identify errors or problems, identify issues or misunderstandings, assess, critique, diagnose, evaluate, edit, revise The student can identify and explain logical or factual errors in knowledge.
	Classifying	classify, organize, sort, identify a broader category, identify different types/categories The student can identify super ordinate and subordinate categories to which information belongs.
	Matching	categorize, compare & contrast, differentiate, discriminate, distinguish, sort, create an analogy or metaphor The student can identify similarities and differences in knowledge.
2 Comprehension	Symbolizing	symbolize, depict, represent, illustrate, draw, show, use models, diagram, chart The student can depict critical aspects of knowledge in a pictorial or symbolic form.
	Integrating	describe how or why, describe the key parts of, describe the effects, describe the relationship between, explain ways in which, paraphrase, summarize The student can identify the critical or essential elements of knowledge.
1 Retrieval	Executing	use, demonstrate, show, make, complete, draft The student can perform procedures without significant errors.
	Recalling	exemplify, name, list, label, state, describe, who, what, where, when The student can produce information on demand.
	Recognizing	recognize (from a list), select from (a list), identify (from a list), determine if the following statements are true The student can determine whether provided information is accurate, inaccurate or unknown.

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

1. Which cognitive skills had the highest number of assessment questions? Lowest number?

Based on the table, most of the questions fall under the Remembering level, while the fewest are under Creating, Metacognitive, and Self-system thinking. This means that the Resource Teacher's assessments mainly focus on recalling information or identifying basic facts, like asking, "What is the first step of electricity transmission?" These kind of questions, test how well students can recall what they have learned. However, there are very few questions that push students to analyze, evaluate, or create something new. This suggests that the test leans more toward lower-order thinking skills rather than higher-order thinking.

2. What do these (lowest and highest number of assessment questions) reveal about Resource Teacher's level of questions?

The pattern of questions shows that the Resource Teacher's questioning mostly stays within the lower cognitive levels. Many of the questions focus on Remembering and Understanding, which are about recalling facts and explaining ideas in simple terms. This indicates that the teacher gives more emphasis on making sure students have mastered the basics before moving on to more complex reasoning. However, it also means there are limited opportunities for students to engage in higher-order thinking, such as analyzing or creating their own ideas.

3. Based on Kendall's and Marzon's taxonomy, which are the highest cognitive skills? Give an example of an assessment question for each of the two highest cognitive skills-metacognitive skills and self-system thinking.

In Kendall's and Marzano's taxonomy, the two highest levels of cognitive skills are Metacognitive and Self-system thinking. It says that metacognitive skills involve being aware of how one learns, planning, checking, and assessing one's own understanding. A good example of a metacognitive question is, "How did you come up with your answer, and what process helped you understand the lesson better?" Meanwhile, self-system thinking relates to one's motivation, beliefs, and personal connection to learning. A sample question for this could be, "Why do you think understanding how electricity is distributed matters in your daily life?" These types of questions allow students to reflect on their learning experiences and connect them to real-life situations.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

If you were to rate yourself on HOTS – where will you be from a scale of 1 to 5 (5 as highest) where will you be?

I would honestly place myself at around 4 out of 5 when it comes to Higher-Order Thinking Skills (HOTS). I can analyze ideas deeply, connect concepts, and come up with creative ways to solve problems. But still, I know there is a room to grow, especially in combining information from different sources and forming more refined, critical viewpoints. I see learning as a continuous process, and every challenge I face in life helps sharpen my ability to think more wisely. My goal is to keep expanding my understanding and become more confident in applying critical and creative thinking in various situations in my life.

As a future teacher, reflect on how will you contribute to the development of learners' HOTS?

As a future educator, I want to guide my students toward developing their Higher-Order Thinking Skills by going beyond simple recall in my class. I plan to design learning experiences that make them question, reason, and create their own ideas. Doing so, I plan to go on seminars that will help me to be the kind of teacher my students need. In my class, I will encourage open discussions and problem-solving tasks where they can think critically and express their insights freely. I also believe that giving meaningful feedback will be one of my priorities, so they can learn how to improve their reasoning and judgment. In the long run, I hope to nurture learners who are not just knowledgeable, but also thoughtful, and capable of making sound decisions in real-life situations.

Activity 13.6

Analyzing a Table of Specifications

Resource Teacher: **Sir Kim Paolo Armin A. Torcelino VI** Teacher's Signature:

School: **Abaño Laboratory** Grade/Year Level: **10** Subject: **Science** Date: **10/07/25**

TARGET Your Intended Learning

- Explain the function of a Table of Specifications

REVISIT the Learning Essentials

- Table of Specifications (TOS) is a two-way chart that describes the topics to be covered by a test and the number of items or points that will be associated with each topic.
- Sometimes the topic of items is described in terms of cognitive level as well.

1. Study the sample Table of Specifications on Assessment

Learning Outcome	No. of Class Hours	Cognitive Level						Total
		Rem	Un	Ap	An	Ev	Cr	
1.								
2.								
3.								
4.								
5.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

1. What parts must a TOS contain to ensure test content validity?

A Table of Specifications (TOS) should include the learning outcomes, topics or content areas, the number of class hours, and the different cognitive levels such as remembering, understanding, applying, analyzing, evaluating, and creating. These parts make sure that every test item matches what was actually taught and how deep students are expected to learn it.

2. Why is there a need for several items per cognitive level?

Having several items per cognitive level ensures that the assessment fairly measures the students' understanding at different depths. It also avoids focusing too much on one skill, like just remembering, and instead checks how well students can apply, analyze, or create based on what they have learned.

3. With OBE in mind, is it correct to put learning outcomes not topic in the first column? Why or why not?

Yes, because in Outcomes-Based Education, the main focus is what learners are expected to achieve by the end of the lesson. Putting learning outcomes first will help the teacher align the test with those outcomes rather than just the lesson content. In this way, the assessment becomes more meaningful and focused on the outcomes.

4. Can a teacher have test with content validity even without making a TOS?

It is possible, but not guaranteed. A teacher might design a valid test based on experience or clear understanding of the objectives, but without a TOS, there is no solid guide to ensure that all outcomes and cognitive levels are fairly represented. Because having a TOS will make make the process more accurate and transparent.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

Did you have a similar experience? Reflect on it. Will the required use of Table of Specifications as guide in test construction solve the problem of misaligned tests?

Yes, I actually experienced something similar back in my early high school years. I still remember what happened that day, it was in our Mathematics subject where our teacher includes something she did not teach us. After the exam, I felt disappointed together with my classmates and confused because we studied so hard, only to realize that many of the questions came from topics that were not tackled at all. It made me question the fairness and purpose of the assessment since it didn't really measure what we learned. Back then I didn't know that **Table of Specifications (TOS)** is such a thing so I didn't really pay attention about it and just moved on.

Reflecting on that experience, now that I have a knowledge about TOS, I think it is very important to make the TOS transparent to the students after taking the exam, and that could really help solve this kind of problem. A TOS ensures that every test item is aligned with the learning objectives and lessons actually taught. It serves as a clear guide for teachers to balance both the content and cognitive levels in their tests. If my teacher back then had used a TOS and let us see it after we took the exam, it would have been more valid and connected to what we studied. We may also not feel any frustrations or disappointments towards her because there is a proof of where the test questions came from. It is a simple but powerful solution to the problem. TOS is a great tool that promotes fairness and makes sure assessments truly reflect students' learning.

SHOW your Learning Artifacts

- Accomplished Observation Sheet
- Analysis

After this activity, I was reminded that a well-structured Table of Specifications (TOS) is essential for ensuring test content validity. The TOS should list specific learning objectives, content areas, the number of items for each area, and the cognitive levels being assessed. It is also taught that's spreading items across cognitive levels creates a balanced assessment that reflects students' understanding and reduces errors. Although a test can sometimes be content-valid without a TOS, the TOS is the most reliable way to align items with learning objectives and avoid imbalances which ensure a comprehensive assessment for the students.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

- Reflection

The short conversation between Student A and Student B clearly shows how students feel when what appears on a test doesn't match what was actually taught in class. Their frustration points out how important it is for teachers to make sure that their assessments are connected to the lessons they have discussed. I have also experienced this kind of situation back in high school, and it was really discouraging to study hard only to face questions that seemed unfamiliar. That is why teachers should always communicate their assessment plans clearly and give students time to practice the skills that will be tested. Because having a Table of Specifications (TOS) can really help with this, it ensures that the test items are aligned with the learning objectives, to make the assessment more organized, and fair.

- Completed Sample TOS

Topics	Hours Allotted	Weight	Remembering (<u>30</u> %)		Understanding (<u>30</u> %)		Analyzing (<u>40</u> %)		Total

Episode 13 - Assessment OF Learning (Summative Assessment)

Activity 13.7

Computing Student's Grades based on DepEd Grading System

Resource Teacher: Sir Kim Paolo Armin A. Torcelino VI Teacher's Signature: _____

School: Abaño Laboratory Grade/Year Level: 10 Subject: Science Date: 10/07/25

TARGET Your Intended Learning

- Compute student's grade based on DepEd's grading policy.
- State the new feature of the latest grading system in basic education

REVISIT the Learning Essentials

- With the implementation of the Enhanced Basic Education Program of 2013, more popularly known as the K to 12 Curriculum, came a new grading system of the Department of Education. Refer to Appendix A for more details.
- The latest grading system in basic education includes students' performance in written tests and performance tasks, with emphasis on the latter. The quarterly exam may be a combination of written test and performance task.

OBSERVE

A. Sample Students' Report Card

1. Secure a sample of a Students' Report Card from your Resource Teacher.
2. Study a sample of an unused Student's Report Card. Observe its contents.
3. Ask permission from your Resource Teacher for an interview with him/her and with a group student regarding the new grading system.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

B. Interview of Resource Teacher

1. What are the new features of the latest grading system? What things are you required to do with this new grading system which you were not asked before?

“There are no new features in the latest grading system. It stays the same as before, so we are still required to do the same things as in the previous grading periods. Nothing new has been added or changed in the requirements.”

3. Which do you prefer — the old or the new grading system? Why?

“I prefer the old grading system because it is already familiar and easier to understand. Since there are no major changes, it allows students to focus more on learning rather than adjusting to a new system. It’s also consistent, so we already know what to expect in terms of grading and requirements.”

C. Interview of 5 Students

1. What do you like in the new grading system?

Most of the students said they liked the new grading system because it puts more importance on performance-based assessments. For them, it is better since it values creativity and skills, which they feel were often overlooked before. They also shared that this setup motivates them to dig deeper into their lessons and apply what they learn in real situations. One student even mentioned that she likes being able to track her own grades and easily see which parts she needs to improve on.

2. Do you have problems with the new grading system. If there is, what?

Almost all of the students said they don’t really have any problems with the new grading system and even praised how fair and transparent it is. However, one student pointed out that she was confused about her grades dropping unexpectedly even though she met all the requirements. She found it a bit frustrating and suggested that maybe the grading process or criteria could be explained more clearly. Overall, while most students are adjusting well, there are still areas where communication and consistency can be improved.

3. Does the new grading system give you a better picture of your performance? Why or why not?

All five students agreed that the new grading system reflects their performance more accurately. They liked that it focuses more on performance tasks, which allow them to show what they can really do. According to them, this kind of assessment helps them see their strengths and areas they still need to work on. It also encourages them to be more active and involved in learning instead of just memorizing for exams.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

4. Which do you prefer - the old or the new grading system? Why?

Most of the students preferred the new grading system because it focuses on performance tasks and gives them a chance to pass even if they don't do well in exams. They think it is a fairer way to show what they have learned through actual application, and it helps reduce the stress that comes with traditional tests.

D. Review of DepEd Order # 8, s. 2015

Read DepEd Order # 8 s. 2015. You may refer to https://www.deped.gov.ph/wp-content/uploads/2015/04/DO_s2015_08.pdf

Based on DepEd Order 8, 8. 2015, answer the following:

1. What are the bases for grading?

The bases for grading includes:

- Learners' performance in assessments (quizzes, tests, projects, tasks) that are valid, reliable, and varied.
- Daily work, class participation, assignments, and other formative assessments.
- Major assessments such as periodic and quarterly exams.
- Authentic assessments like portfolios, performance tasks, and other applicable instruments.

These three components have different weights depending on the subject and learning area.

2. How do you compute grades per quarter for Grades 1 to 10 and Grades "11 to 12. Give an example.

For Grades 1 to 10, quarterly grades are computed by averaging the periodic grades (periodic assessments) and quarterly assessments (major exams or summative tasks) plus other assessment components (daily work, projects, class participation). These are weighted appropriately.

- **Example For Grades 1-10:** Written Work = 25-40%, Performance Tasks = 40-50%, Quarterly Assessment = 20-30% (exact percentages vary by subject). Total:100%

For **Grades 11 to 12**, the quarterly grade is computed by combining formative assessment scores and summative assessment scores (similar idea) but aligned with Senior High School curriculum weights.

- **Example For Grades 11-12:** Written Work = 25%, Performance Tasks = 50%, Quarterly Assessment = 25%. Total:100%
-

3. How do you compute grades at the end of the school year?

At the end of the year, you average the quarterly grades across all quarters (usually four) to get the final grade. So, Final Grade = $(Q1 + Q2 + Q3 + Q4) \div 4$ (or weighted average, depending on the subject).

Management
System
ISO 9001:2015
www.tuv.com
ID 9108653506

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

4. What descriptors and grading scale are used in reporting progress of learners?

The descriptors and grading scale that is used in reporting progress of learners are:

- **90-100:** Outstanding
- **85-89:** Very Satisfactory
- **80-84:** Satisfactory
- **75-79:** Fairly Satisfactory

Below 75: Did Not Meet Expectations

5. What are the bases for learners' promotion and retention at the end of the school year?

A learner is promoted if they get a final grade of 75 or higher in all learning areas. If they get below 75 in any subject, they may need remediation or be retained.

6. What is the report on learners' observed values?

The report on learners' observed values is a separate report in which teachers document and report the learner's performance in values education or character formation. It reflects how students live out values such as responsibility, respect, honesty, and other core values. This is not graded in the same numerical way but is reported in terms of descriptors reflecting observed behaviors.

E. Grade Computation

Show sample computations of a grade:

- In a subject of your choice from Grades 1 to 6 (if you are a future elementary teacher)
- in your specialization if you are a high school teacher)
- Show the percentage contributions of written work, performance tasks and quarterly assessment. Then give the descriptor. Refer to DepEd Order # 8, s. 2015.

EXAMPLE:

Subject: Science (Grade 9)

Grading Components and Weight:

- **Written Work – 25%**
- **Performance Tasks – 50%**
- **Quarterly Assessment – 25%**

Sample Computation:

Let's say a student got the following:

- Written Work Average = 80
- Performance Tasks Average = 90

Management
System
ISO 9001:2015

CAMARINES NORTE STATE COLLEGE

F. Pimentel Avenue, Brgy. 2, Daet, Camarines Norte – 4600, Philippines

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

- Quarterly Assessment = 85

Step 1. Multiply each component by its weight:

- Written Work: $80 \times 25\% = 20$
- Performance Tasks: $90 \times 50\% = 45$
- Quarterly Assessment: $85 \times 25\% = 21.25$

Step 2. Add the weighted scores:

$$20 + 45 + 21.25 = 86.25$$

Step 3. Final Grade (rounded off):

86

Descriptor (based on DepEd Order No. 8, s. 2015):

86 – Very Satisfactory

Final Grade in Science: 86 (Very Satisfactory)

This means the learner has demonstrated a good understanding of scientific concepts and can apply them in various activities and experiments, showing consistent performance throughout the quarter.

Analyze data and information gathered from the interview and from your interview of an unused Student's Report Card and the DepEd grading system.

1. Do teachers and students like the new grading system? Why or why not?

Based on our observation, according to the resource teacher he doesn't make any report card because he is not an advisory teacher. Because of this, we were unable to provide data for this and also for the following questions.

2. What are the good points of the new grading system according to teachers? according to students?

Episode 13 - Assessment OF Learning (Summative Assessment)

3. What are teachers challenged to do by this new grading system?

4. Do you favor the distribution of percentages of written work, performance tasks, and | quarterly assessments?

5. Did you like the experience of computing grades? Why or why not?

In an era where the emphasis is self-directed learning and demonstration of competencies - knowledge, skills, and values learned (outcomes-based education)- do grades matter?

We can't deny that grades will always be part of learning, but I have realized they don't always show everything a student can do. In today's setup where we focus more on outcomes-based education, what really matters is how the students apply what they have learned, not just the numbers written on their report cards. A grade may show how well someone performed in tests or tasks, but it can't always measure effort, creativity, or growth.

When I was in high school, I remember getting a poor grade in a subject I really worked hard on. I spent nights studying, but my score didn't reflect the effort I gave. I was the one you who excels in that class and I am sure of that. I felt frustrated, thinking that maybe grades were the only thing that mattered. But later on, I realized that real learning goes beyond that. It is about how much I understood, how I improved, and how I could use that knowledge in real situations.

Episode 13 - Assessment OF Learning (Summative Assessment)

That lesson became clearer in college when my group and I built *The Bumble-Box*, a box storage device using syringes and water to demonstrate Pascal's Principle. It wasn't graded through a paper test but through performance and creativity. Seeing our idea come to life felt more rewarding than any high score I had received. That experience reminded me that while grades are important, what truly matters is the learning we carry with us and how we use it to create, innovate, and inspire others.

Reporting Students' Performance

Resource Teacher: **Sir Kim Paolo Armin A. Torcelino VI** Teacher's Signature: 

School: **Abaño Laboratory** Grade/Year Level: **10** Subject Area: **Science** Date: **10/07/25**

TARGET Your Intended Learning

- State the reason(s) why grades must be reported to parents.
- Describe what must be done to make grade reporting meaningful.

REVISIT the Learning Essentials

- Grades fulfill their function if reported meaningfully to students and most of all to parents, our partners in the education of children.
- Grades are a measure of achievement, not necessarily IQ. A student may have high IQ but not necessarily achieving or performing because of lack of motivation or other factors.

OBSERVE

Proceedings in a Card Distribution Day

1. Observe how cards are distributed on Card Distribution Day. Describe how cards are distributed.

We first asked sir Kim about this, but he said that the class adviser is the one who distributes the Card of the students. When we interviewed the Grade 10 adviser, which is Ma'am Pante, she shared how she manages the distribution of the students' report cards. She explained that it is done through a formal meeting held at the school. She also takes into account about the parents' work schedules, so she usually schedules the distribution on a Saturday to ensure most parents can attend. Once the parents arrive, the meeting begins with a prayer, followed by the discussion of the agenda, which includes school concerns, upcoming projects, and the card distribution itself. During the distribution,

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

Ma'am Pante calls the students' names in alphabetical order to maintain an organized flow. She also gives parents time to review their child's report card and encourages them to ask questions or raise any clarifications about their child's grades, which she addresses right away.

2. Describe how the Resource Teachers communicated learners' assessment results and grades to parents.

Again, Ma'am Pante the class adviser is the one who communicates with the parents in a respectful and professional manner, especially when discussing learners' grades and assessment results. She makes sure to explain things clearly and thoughtfully. During the meeting, she provides each parent with their child's report card along with a detailed record of their assessments to support the grades shown. This helps her address any possible questions or concerns right away. She also takes time to explain the results carefully, to make sure that the parents fully understand their child's progress and performance in school.

3. Did parents raise questions or concerns? If yes, what were their questions/concerns?

From our interview with Ma'am Pante, we found out that most parents asked about their child's strengths, weaknesses, and behavior both inside and outside the classroom. They wanted to know how they could better support their children's learning at home. Some parents also raised questions about homeroom projects and other school activities that their children were involved in.

4. How did the Resource Teacher handle their questions and concerns? What answers did he/she give?

The class adviser, Ma'am Pante responded to the parents' questions in a calm and understanding way. She always made sure each parent felt listened to and valued by patiently hearing their concerns. She provided clear explanations, examples, and practical advice on how they could guide their children's learning at home, emphasizing that learning should continue beyond the classroom. She also addressed grade-related questions with transparency by showing detailed records and explaining how the grades were computed, ensuring that everything was fair for all learners.

Interview with Resource Teacher

1. How do you give feedback to your students regarding their performance? When do you give feedback?

According to Sir Kim, he gives feedback to his students by pointing out both their strengths and areas that need improvement after every activity, quiz, or performance task. He provides feedback right after checking their work, either verbally or through written notes, so students can quickly understand where they went wrong and what they can do better. He also makes sure to include words of encouragement and practical suggestions to help them improve in their next tasks.

Episode 13 - Assessment OF Learning (Summative Assessment)

2. How do you report students' performance to parents? Does the school have a regular way of reporting grades to parents?

Since Sir Kim is not an adviser of any particular class, he is not directly in charge of reporting students' grades to parents. However, he makes it a point to inform the adviser whenever he notices any changes in a student's behavior or performance. According to Ma'am Pante, the Grade 10 adviser, she communicates students' performance both informally, through group chats on Messenger and formally during card-giving or parent meetings. This way, parents are consistently updated and aware of their child's academic progress and classroom behavior.

3. What problems on grade reporting did you encounter with parents? How did you address it/them?

Based on our interview, Sir Kim has not encountered any issues or complaints from parents regarding students' grades. Similarly, Ma'am Pante mentioned that she has not faced any major concerns about grade reporting so far. However, both teachers shared that if such a problem arises, they would handle it professionally by setting a formal meeting with the parent. During the discussion, they would present all the necessary documents, including detailed assessment records and, if needed, samples of the student's work, to clarify and justify how the grades were computed fairly.

Interview with Students

1. Do you see the meaning of your grades in the School Report Card?

When we talked to the Grade 10 students, they mentioned that understanding the meaning of their grades in the report card is quite easy for them. They explained that the card clearly shows descriptors, the grading scale, and remarks—like "Outstanding" for 90–100, which means passed, and "Did Not Meet Expectations" for below 75, which means failed. They said this helps them interpret their performance better since they can identify which subjects they excel in and which ones they still need to improve on. Because of that, they become more aware of their learning strengths and weaknesses.

2. Does knowing your grade motivate you to work harder?

According to the learners we interviewed, seeing their grades actually pushes them to put in more effort. They said their grades serve as a reflection of how well they are doing in school. Some shared that when they get higher scores than expected, it inspires them to aim even higher next time. On the other hand, those who get lower grades take it as a challenge to study harder and perform better in the next quarter. In both cases, their grades become a motivation to keep improving.

Interview with Parents

1. Does your child's Report Card give you a clear picture of how your child is performing?

The parents shared that their child's report card clearly shows how their child is doing in school. They said it helps them see both the strengths and areas where their child needs more support. Through it, they can think of ways to help at home, like assisting with lessons, guiding in study habits, or encouraging participation in class. They also mentioned that the report card gives them updates not only about academics but also about their child's behavior and overall growth in school.

2. If you were asked what else should be found in the Report Card, which one? Why?

Most of the parents suggested adding a section that focuses on the child's soft skills and personal development, not just the usual core values. They explained that it would be helpful if the report card also reflected qualities like teamwork, leadership, problem-solving, and attitude toward learning. For them, this would provide a more complete picture of their child, not just as a student but as a growing individual, allowing parents to understand how their child is developing beyond academics.

3. Do you find the Card Distribution Day important? Why or why not?

All parents agreed that Card Distribution Day is important. They said it gives them a chance to personally talk to teachers and be updated about their child's progress. It helps them see which subjects their child excels in and which ones need more attention. They also value the opportunity to ask questions, clarify concerns, and work together with teachers to support their child's learning journey.

4. Any suggestion on how to make Card Distribution more meaningful?

Parents recommended adding a feedback system, such as short surveys, where they can share their thoughts about the school's performance. They believe this would make Card Distribution Day more meaningful since it allows them to express suggestions for improvement and take part in enhancing the quality of education their children receive.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 13 - Assessment OF Learning (Summative Assessment)

1. What were the most common issues raised on students' performance?

From what we have noticed, most of the concerns shared by parents were about identifying their children's strengths and weaknesses. They wanted to better understand the areas where their child finds it hard to cope and how they could help at home. Another issue that came up was behavior, both in class and outside of it, because the parents wanted to find ways to guide their children to act more responsibly. Some also asked about their child's involvement in homeroom projects and extracurricular activities to make sure they were learning beyond academics. Overall, the parents aimed to have a complete picture of their child's growth and performance.

2. Based on your observations and findings, what practices must be

a) maintained

It is good to keep the practice of distributing report cards through a formal meeting like Card Distribution Day. Ma'am Pante's idea of setting it on a Saturday was practical since it gives working parents a chance to attend. The system of calling names alphabetically also made the process organized and smooth. The teachers' willingness to answer questions and clarify concerns on the spot helped build open communication and stronger parent-teacher relationships.

b) improved to make grades and reporting meaningful

For me, to make grade reporting more effective, schools could add ways for parents to share their feedback, like short surveys after card distribution. Another improvement would be to include a section that highlights students' soft skills and personal qualities. This way, the report card won't just reflect academic scores but also the child's overall growth, giving parents a clearer idea of their development as a whole person.

Episode 13 - Assessment OF Learning (Summative Assessment)

1. Grades are often a source of misunderstanding. How should I do the reporting so that it will result to effective learning?

Back when I was in high school, I remember how report card days would always make a students like me anxious. Some of my classmates would celebrate after seeing their grades, while others would quietly stare at their cards, trying to figure out what went wrong. I once experienced getting a grade that surprised me because I thought I did well and I am sure I was one of the best if not the best, and yet I get a poor grade. But instead of understanding the reason behind it, I was left confused since there was no clear explanation from my teacher. That experience made me realize how important it is for teachers to communicate grades properly, and treat it not just as numbers, but as reflections of students' efforts and learning progress because it will sure affect the mental health of his/her students, like it did to me.

If I were to report grades as a future teacher, I would make sure that my students and their parents understand what those numbers truly mean. I will provide clear feedback, showing not only where the student needs improvement but also recognizing what they did well. I want grades to serve as a guide for growth, not as a punishment or a label of one's ability. So, when I report grades in the future, I will make sure it helps my learners see their progress, understand their mistakes, and feel inspired to keep improving.

EVALUATE Performance Task

Evaluate Your Work Task Field Study 1, Episode 13 -Assessment of Learning

Learning Outcomes: determine the alignment of assessment tools and tasks with intended learning outcomes; critique traditional and authentic assessment tools and tasks for learning in the context of established guidelines on test construction; evaluate non-traditional assessment tools including scoring rubrics; examine different types of rubrics used and relate them to assessment of student learning; distinguish among the three types of learner's portfolio; evaluate a sample portfolio; construct assessment questions for HOTS following Bloom's Taxonomy as revised by Anderson and Krathwohl and Kendall's and Marzano's taxonomy; explain the function of a Table of Specifications; distinguish among types of learners' portfolios and their functions; compute students' grade based on DepEd's grading policy; state the reason(s) why grades must be reported to parents; and describe what must be done to make grade reporting meaningful.
