Episode 9 Preparing for Teaching and Learning

SPARK Your Interest

This Episode emphasizes the principles of learning which must be applied to ensure quality instruction. It also focuses on the intended learning outcomes which set the direction of the lesson. They must be (SMART) **S**pecific, **M**easurable, **R**ealistic, and **T**ime-bound) and formulated by time-tested principles. It also determines the teaching method used by the Resource Teacher whether (inductive or deductive) which is the practical realization or application of an approach. This episode dovetails with the course on Facilitating Learner-Centered Teaching.

TARGET Your Intended Learning

Outcome

At the end of this episode, I must be able to:

- Identify the teaching-learning practices that apply or violate the principles of teaching-learning;
- Determine the guiding principles on lesson objectives/learning outcomes applied in instruction;
- Judge if lesson objectives/intended learning outcomes are SMART;
- Determine whether or not the intended learning outcomes are achieved at the end of the lesson;
- Observe the teaching methods used by the Resource Teacher; and
- Differentiate the different methods of teaching.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

REVISIT the Learning Essentials

These are the time-tested principles of teaching and learning;

- 1) Effective learning begins with setting clear expectations and learning outcomes.
- 2) Learning is an active process. “What I hear, I forget, what I see, I remember; what I do, I understand.”
- 3) Learning is the discovery of the personal meaning of ideas. Students are allowed to connect what they learned with other concepts to learn with real-world experiences and with their own lives.
- 4) Learning is a cooperative and collaborative process.

A teaching method consists of systematic and orderly steps in the teaching-learning process. It is a practical realization or application of an approach. All methods of teaching can be classified either as deductive (direct) or inductive (indirect).

OBSERVE, ANALYZE,
REFLECT

Activity 9.1

Demonstrating an Understanding of Research-Based Knowledge Principles of Teaching and Learning

Resource Teacher : Sir Kim Paolo Armin A. Torcelino VI Signature:  School: Abaño Laboratory

Grade/Year Level : Grade 10-Naghihimagsik Subject Area : Science Date: 9/23/25

OBSERVE

Observe a class with the use of principles of learning given in Revisit the Learning Essentials. I will identify evidence of applications/violations of the principles of learning. I can cite more than one piece of evidence per principle of learning.

Principles of Learning	What did the Resource Teacher do to apply the principle of learning
1. Effective learning begins with the setting of clear and high expectations of learning outcomes.	Based on my observation, before the lesson start, the Resource Teacher clearly explained the objectives and also, what the students were expected to accomplish by the end of a certain activity.
2. Learning is an active process.	When teaching some lesson that may require materials which is difficult to provide, like teaching a projectile motion using a ball and a canon ball, the Resource Teacher uses free simulation website available on the internet. He also teach the students how to maneuver the website by themselves to and have them explore it. Beside this, when they conduct an experiment, the resource teacher let the

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

	students perform it hands-on, where they observed and recorded their own results instead of just listening to a lecture.
3. the discovery of personal meaning and relevance of ideas.	Based on my observation the Resource Teacher relates the topic of their lesson to everyday situations, and asking students to share examples from their own experiences to show how the lesson connects to real life.
4. Learning is a cooperative, but a collaborative process. Learning is enhanced in an atmosphere of cooperation and collaboration.	In some instances and experiment activity, the Resource Teacher grouped the students and encouraged them to work together in completing the experiment and discussing their answers to the class after the activity is done.

ANALYZE

1) What principles of learning were most applied? least applied?

Most applied

Based on my observation, "Learning is a cooperative, but a collaborative process. Learning is enhanced in an atmosphere of cooperation and collaboration" is the most applied principles of learning I observed in the classroom. Whether it is the lesson is about solving problems or conducting an experiment, collaboration is always observed and cooperation is always highlighted. When conducting a group experiment, I observed that every group in the class were not just collaborating with their own members but they are also open to communicate with the other groups. They share insights and questions that opens a somewhat short discussion of sharing ideas that results positive impact on both parties. They also showcase this collaboration even in individual class activities, like when the class is having a problem solving activity. When a some students don't get the right answer, they quickly ask those students that got the correct answer. Genuinely, those students who got the correct answer explain the step-by-step process of what they did to help their classmates not only get the right answer but also understand the problem.

FS1

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

Least applied

Based on my observation it is somewhat changing everyday and every type or kind of discussion the resource teacher is doing, like the day of september 23, 2025, the principles of learning that is least applied is “The discovery of personal meaning and relevance of ideas.”. In that day, they conducted a simple experiment, wherein the resource teacher divide the class into four groups and provided a simple activity sheet for the students to follow. Like this approach of many science teachers, they tend to focus on content delivery, experiments, and factual understanding (laws, theories, formulas) rather than deeply connecting the lesson to students’ personal experiences or helping them find individual relevance in the concepts. Although “The discovery of personal meaning and relevance of ideas.” is very important and I also have noticed it sometimes, but it times like conducting a group experiment, it doesn’t seem to be necessary so most of the time it is disregarded.

Give instances where this/these principles/s could have been applied?

I think in situation like, during a lesson on climate change, can this principle could have been applied. In discussing the lesson the teacher could have asked students to reflect on how changing weather patterns affect their own community, example typhoons in the Philippines, rising temperatures, or local flooding. In this way, the students could share their family experiences or small actions they can take to reduce carbon footprint. I think this approach helps them connect scientific concepts to their daily lives and personal responsibilities.

REFLECT

From among the principles of learning, which one do you think is the most important?

For me, the most important principle of learning is “The discovery of personal meaning and relevance of ideas.”. I personally believe, that when a lesson connects to ones own experiences or the things they care about, it stays with them longer and makes more sense, like it is to me. In my science classes, I notice that I learn better when the teacher relates the topic to real-life situations, like how climate change affects our community or how some simple experiments explain things I see every day. It makes me feel that what I’m learning is not just for passing tests but something I can actually use or reflect on in my life. Most of all, this principle reminds me that learning becomes more meaningful when I can see myself in it.

Activity 9.2

Identifying Learning Outcomes that are Aligned with Learning Competencies

Resource Teacher : Sir Kim Paolo Armin A. Torcelino VI Signature:  School: Abaño Laboratory

Grade/Year Level : Grade 10-Naghihimagsik Subject Area : Science Date: 9/23/25

OBSERVE

Observe a class, this time focusing on how the learning outcomes were stated. Determine if the learning outcome/s was/were achieved or not. Give evidences.

1. Write the learning outcomes stated in the lesson.

Learning Outcomes	(SMART Objectives)		Achieved	
	Yes	No	Yes	No
1) Understand that momentum depends on both mass and velocity.	✓		✓	
2) Conduct an experiment to measure the momentum of a bouncing ball.	✓		✓	
3) Develop a curiosity about why different surfaces and materials affect collisions differently.	✓		✓	
4)				
5)				

2. Cite pieces of evidences that these learning outcomes were achieved.

1) I observed that the students were able to grasp the idea that momentum depends on both mass and velocity when they confidently explained their answers during the class discussion. Many of them participated by giving real-life examples, such as comparing a moving truck and a bicycle. Their ability to connect the concept to everyday situations showed clear understanding.

Episode 9 Preparing for Teaching and Learning

2)	<u>Evidence that this outcome was achieved was seen during the hands-on activity. The students carefully measured the mass and velocity of the ball and recorded their data accurately. They worked collaboratively, computed the momentum correctly, and shared their findings with the class. Their active engagement throughout the experiment showed that they achieved the learning goal.</u>
3)	<u>I noticed that the students became genuinely curious during the experiment when they observed how the ball bounced differently on various surfaces. Some of them asked follow-up questions and tried to test other materials on their own. Their excitement and eagerness to explore further proved that curiosity was successfully developed among them.</u>
4)	
5)	

ANALYZE

1) Do SMART objectives make a lesson more focused?

Yes, it is very clear that SMART objectives definitely make a lesson more focused. For me, they serve as a clear guide for both the teacher and the students. When objectives are Specific, Measurable, Achievable, Relevant, and Time-bound, it is easier to stay on track and know exactly what needs to be accomplished by the end of the lesson. One thing that is also good in using SMART is it avoids confusion and helps the teacher plan activities that directly lead to the goal instead of just doing random tasks. I also noticed that when objectives are SMART, assessments become more meaningful because they're directly connected to what students are expected to learn. In short, SMART objectives make the whole teaching process organized and purposeful, which leads to better learning outcomes and smoother class flow.

Episode 9 Preparing for Teaching and Learning

REFLECT

Reflect on the

Lessons learned in determining SMART learning outcomes.

In determining SMART learning outcomes, I've learned how important it is to be clear and specific about what I want my students to achieve. Before, I used to write objectives like "students will understand the topic," but now I realize that's too vague. Through experience in college especially when I made my first few lesson plans during my early years, I saw how having unclear objectives made it harder to assess if my students really learned something. But, SMART outcomes guide me to focus on what truly matters, what students should be able to do, how I'll measure it, and if it's realistic within the time I have.

I also learned that making objectives measurable helps me design better activities and assessments. For example, instead of saying "students will learn about photosynthesis," I can say "students will be able to explain the process of photosynthesis using a diagram." That small change gives direction not only to me as a teacher but also to the students, since they know exactly what is expected of them. Lastly, I realized that SMART outcomes don't just make lesson plans look neat, they make learning meaningful and attainable. It reminds me of how I plan my own goals as a student: when I set realistic and specific targets, I achieve more. So, as a future teacher, I'll always make sure my learning outcomes are SMART, because they help turn my lessons from just plans on paper into real learning experiences that make sense for my students.

Activity 9.3

Distinguishing Between Inductive and Deductive Methods of Teaching

Resource Teacher : Sir Kim Paolo Armin A. Torcelino VI Signature: [Signature] School: Abaño Laboratory

Grade/Year Level : Grade 10-Naghihimagsik Subject Area : Science Date: 9/23/25

OBSERVE

I will observe one Resource Teacher with the use of this observation sheet. Using the guide questions, I shall reflect on my observations and analysis.

Teacher-centered	Student-centered
Did the teacher lecture all the time? <u>No, the teacher did not lecture all the time. While there was a short explanation during the "Explain" phase, most of the lesson involved group activities and problem-solving.</u>	Were students involved in the teaching-learning process? How? Or were they mere passive recipients of instructions? <u>Yes, students were actively involved through group activities such as "Arrange Me" and "Bouncing Ball". They collaborated, measured data, analyzed results, and applied formulas, showing active participation rather than passivity.</u>
Was the emphasis on the mastery of the lesson or on the test? Prove. <u>The emphasis was partly on mastery since the teacher explained the formula and provided examples, followed by evaluation tasks to test understanding.</u>	Was the emphasis on the students' application of the lesson in real life? Give proofs. <u>Yes, students were encouraged to connect concepts to real-life applications. The "Bouncing Ball" experiment helped them</u>

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

	<u>understand how mass and velocity affect momentum in real-world motion and collisions.</u>
Was class atmosphere competitive? Why? <u>Yes, during the “Arrange Me” activity, groups competed to rearrange jumbled words correctly and quickly, promoting a healthy sense of competition.</u>	Was class atmosphere collaborative? Why? <u>Yes, the “Bouncing Ball” experiment required teamwork in measuring, recording, and analyzing data. Students worked together to complete tasks and discuss their findings.</u>
Did teacher focus only on one discipline/subject? <u>Primarily yes, the focus was on Physics, especially the concept of momentum.</u>	Did teacher connect lesson to other disciplines/subjects? <u>Slightly, yes. The activity involved Math skills (calculating momentum using formulas), and the observation and recording steps related to Scientific Inquiry (Science Process Skills).</u>

What teaching-learning practice shows that teaching approach was:

- Constructivist – The activity “Bouncing Ball” clearly shows a constructivist approach. Students built their own understanding of momentum by doing the experiment and observing how mass and velocity affect motion. Instead of just memorizing formulas, they learned through experience and discovery.
- Inquiry-based - This was seen when students were tasked to investigate how different surfaces affect the ball’s bounce. They asked questions, gathered data, and drew conclusions from their findings. The teacher guided them, but the learning came mostly from their own inquiry.
- Developmentally appropriate - Yes, the activities were fit for Grade 10 students. The lesson used hands-on experiments, group work, and problem-solving that matched their cognitive level and curiosity. It wasn’t too easy or too hard, it challenged them just enough to think critically.
- Reflective - Students had time to think back on what they observed during the experiment and relate it to the formula for momentum. Even the teacher’s reflection part in the lesson plan shows that both learners and teacher reflect on what worked and what needs improvement.

FIELD STUDY

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

- e) Inclusive - The group setup allowed everyone to participate regardless of ability. Tasks were divided, so even shy or less confident students had roles like measuring, recording, or timing. No one was left out of the learning experience.
- f) Collaborative - This was very evident. Students worked together in groups during “Arrange Me” and the “Bouncing Ball” experiment. They shared materials, discussed answers, and helped one another complete the tasks successfully.
- g) Integrative - The lesson didn’t stick to Physics alone, it also integrated Math through calculations and the use of formulas. It even touched Science process skills like observation and analysis. It showed how different subjects connect naturally in learning momentum.

ANALYZE

1. What are the possible consequences of teaching purely subject matter for mastery asn for the test?

If teaching focuses only on mastering the subject and passing the test, students might end up memorizing concepts without truly understanding them. Learning becomes mechanical and short-term, the students may just study to get high scores, not to apply what they learned in real life. It could also lessen their curiosity and creativity because they might see learning as something to survive, not something to enjoy or explore.

2. If you were to reteach the classes you observed, would you be teacher-centered or student-centered? Why?

I would choose to be student-centered teacher because learning becomes more meaningful when students are actively involved in the learning process. When they explore, experiment, and share ideas, they don’t just learn from me, they learn with me and from each other. It also builds their confidence and helps them connect lessons to real-life situations, making the learning experience more alive and purposeful.

OBSERVATIONS OF TEACHING -LEARNING IN ACTUAL SCHOOL ENVIRONMENT

Episode 9 Preparing for Teaching and Learning

REFLECT

Reflect on Principles of teaching worth applying

For me, one principle of teaching that's truly worth applying is learning by doing or Experiential Learning Approach. In my observation, I have realized that students learn best when they actually experience what they're being taught. Just like in life, we don't really understand something until we go through it ourselves. You can read all the driving manuals you want, but you'll never truly learn how to drive unless you get behind the wheel. It's the same in the classroom, students need to explore, experiment, and make mistakes to really learn.

Another principle I value is teaching with empathy. Every learner comes from a different background, and understanding their struggles can make learning more meaningful. In life, I believe that being kind and patient with others helps build trust and that is also true between teachers and students. When learners feel seen and supported, they become more open and active to learning.

So, if I were to apply principles in my own teaching, I will focus on those that bring learning closer to life, where students not only gain knowledge but also develop the heart and curiosity to keep learning beyond the classroom.
